## **WORKSHEET-5**

Student Name: Meenansh Gupta UID: 22BCS16380

Branch: CSE Section/Group: NTPP-603-B

Semester: 6th Date of Performance: 20/2/25

Subject Name: AP-2 Subject Code: 22CSP-351

**Aim(i)**: **88**. You are given two integer arrays nums1 and nums2, sorted in non-decreasing order, and two integers m and n, representing the number of elements in nums1 and nums2 respectively. Merge nums1 and nums2 into a single array sorted in non-decreasing order.

## **Source Code:**

```
class Solution {
public:
    void merge(vector<int>& nums1, int m, vector<int>& nums2, int n) {
        int midx = m - 1;
        int right = m + n - 1;

        while (nidx >= 0) {
            if (midx >= 0 && nums1[midx] > nums2[nidx]) {
                 nums1[right] = nums1[midx];
                  midx--;
            } else {
                  nums1[right] = nums2[nidx];
                  nidx--;
            }
            right--; }
        } };
```

# **OUTPUT:** Testcase Test Result Case 2 Case 3 Case 1 nums1 =[1,2,3,0,0,0] mn = 3 nums2 =[2,5,6] Accepted 59 / 59 testcases passed ☐ Editorial **Solution** ILB2SrjEs1 submitted at Feb 20, 2025 10:01 Runtime Memory 0 ms | Beats 100.00% 🞳 12.32 MB | Beats 39.42% ♣ Analyze Complexity 100% 95.08% of solutions used 0 ms of runtime 50% 0% 1ms 2ms 3ms 4ms 1ms 2ms 3ms 4ms

Code | C++

## **LEARNING OUTCOME:**

- 1. We learnt Merge Sort.
- 2. We learnt how to sort Arrays.

**Aim(ii)**: 278. Suppose you have n versions [1, 2, ..., n] and you want to find out the first bad one, which causes all the following ones to be bad.

You are given an API bool isBadVersion(version) which returns whether version is bad. Implement a function to find the first bad version. You should minimize the number of calls to the API.

## **Source Code:**

```
class Solution {
public:
    int firstBadVersion(int n) {
        long long l = 1, r = n;
        long long m, res = n;
        while(l <= r) {
            m = 1 + (r - 1) / 2;
            if(isBadVersion(m) == 1) {
                r = m - 1;
               res = min(res, m);
            } else {
                l = m + 1;
            }
        }
        return res;
    }
}
</pre>
```

## **OUTPUT:**

## **Accepted** Runtime: 0 ms Case 1 • Case 2 Input n = 5 bad = 4 Output □ Editorial Solution ILB2SrjEs1 submitted at Feb 20, 2025 10:13 (i) (3) Runtime Memory 2 ms | Beats 54.39% 🞳 7.91 MB | Beats 38.04% ♣ Analyze Complexity 60% 40% 0.23% of solutions used 1 ms of runtime 20% 0% 1ms 2ms 3ms 4ms 3ms Code | C++ class Solution { public: int firstBadVersion(int n){ long long l = 1, r = n; long long m, res = n; $while(l \ll r)$ {

## **Learning Outcomes**

1. We learnt how to use Binary Search.

m - 1 + (r - 1) / 2

2. We learnt Edge case Handling.

**Aim(iii):** Given an array nums with n objects colored red, white, or blue, sort them in-place so that objects of the same color are adjacent, with the colors in the order red, white, and blue.

We will use the integers 0, 1, and 2 to represent the color red, white, and blue, respectively.

You must solve this problem without using the library's sort function.

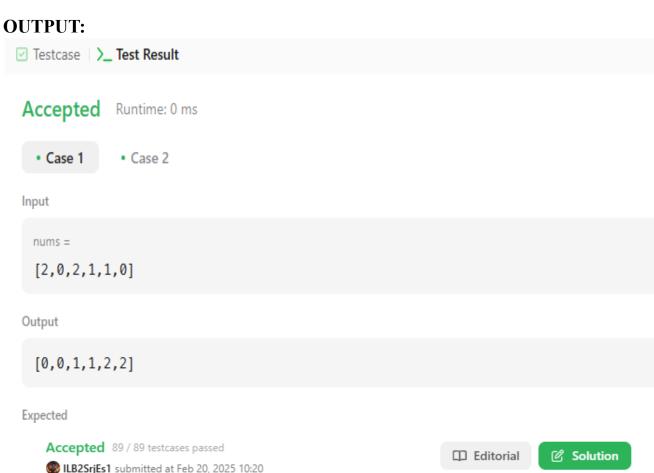

•

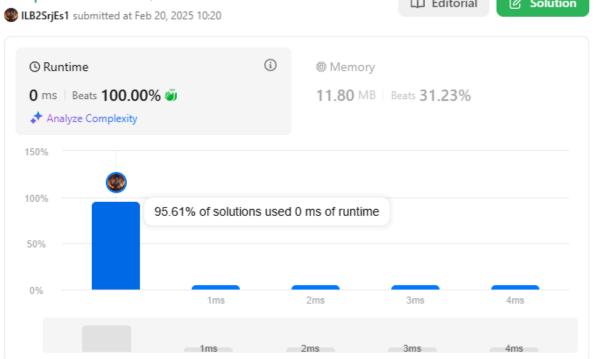

## **Source Code:**

```
class Solution {
public:
    void sortColors(vector<int>& nums) {
        unordered_map<int, int> count = {{0, 0}, {1, 0}, {2, 0}};

    for (int num : nums) {
        count[num]++;
    }

    int idx = 0;
    for (int color = 0; color < 3; color++) {
        int freq = count[color];
        for (int j = 0; j < freq; j++) {
            nums[idx] = color;
            idx++;
        }
    }
}</pre>
```

# **Learning Outcomes**

- We learnt Counting Sort.
   Usage of a Hash Map.
